AspDotNetStorefront Successfully Completes Security Assessment with WhiteHat Security

WhiteHat Sentinel Provides Timely, Comprehensive Website Vulnerability Assessment of E-Commerce Shopping Cart Platform

SANTA CLARA, CA.—February 20, 2007—WhiteHat Security, Inc., a leading provider of website vulnerability management services, today announced that AspDotNetStorefront recently completed a comprehensive vulnerability assessment of its e-commerce shopping cart platform using WhiteHat Sentinel.

As a provider of a storefront platform in use by more than 3,500 Web developers, and more than 5,000 customers including McDonald's and Crocs, AspDotNetStorefront is committed to providing the state of the art e-commerce platform built on asp.net technologies. The Company selected WhiteHat Sentinel, WhiteHat Security's subscription, Web-based vulnerability management service, to ensure customers and developers a secure platform for their e-commerce activity.

Website security issues pose unique challenges to today's enterprises. As website vulnerabilities become increasingly prevalent, with 8 out of 10 sites exploitable, the volume of website attacks has also increased. With no formal industry processes or best practices for ensuring website security, vulnerability issues have made it easier for hackers to attack and harder for enterprises to protect against them.

WhiteHat Sentinel helps organizations identify, prioritize, manage and remediate all website vulnerabilities with accuracy and confidence. It is the only solution to combine proprietary scanning technology with custom testing by a team of leading security experts to provide timely, complete and verified vulnerability information. Only WhiteHat Sentinel looks for all 24 classes of vulnerabilities identified by the Web Application Security Consortium's (WASC) threat classification.

“Since the company’s inception, AspDotNetStorefront has taken great pride in building secure Web applications, and has consistently gone above and beyond industry standard security practices,” said Robert Anderson, CEO of AspDotNetStorefront. “Our decision to partner with WhiteHat reflects our endorsement of WhiteHat’s proactive approach towards the detection of potential security threats. We are pleased to provide our clients with this additional layer of security.”

Anderson continued, “We selected WhiteHat Sentinel because we felt WhiteHat’s comprehensive services were complementary to our culture of proactively addressing potential threats and thwarting them before they have an opportunity to cause damage, as well as to continue to provide our leadership position in asp.net e-commerce shopping cart technology that customers can count on.”

The WhiteHat Sentinel Service conducts hundreds of assessments for real-world websites every month, each providing a unique and current perspective into custom Web applications and vulnerability trends. WhiteHat’s access to timely, cumulative Web application security data helps AspDotNetStorefront achieve a clear view of the security issues affecting its websites.

“We are pleased to support AspDotNetStorefront in its commitment to ensure website security and integrity,” said Stephanie Fohn, CEO, WhiteHat Security. “WhiteHat is proud to offer an easy-to-implement, easy-to-manage, and cost-effective managed service that addresses the complete spectrum of attack vectors used to exploit website vulnerabilities.”

About AspDotNetStorefront
