

Kenna & Whitehat Security: See Risk Across Your Entire Stack

With Kenna and Whitehat, you're able to gain a single, unified view into your risk exposure across entire stack—from your web applications all the way down to your infrastructure. You can clearly see a risk score across the environment and are able to easily communicate that risk to your stakeholders.

Features

App & Infrastructure - All Together Now

See your application's vulnerabilities in tandem with your infrastructure's—with prioritization and reporting across each layer. It's easy to see the whole picture in a single, easy-to-use dashboard.

Near Zero False Positives

All the quality data you expect from Whitehat: false positives are identified and removed by a team of trained researchers.

Streamline Your Process

When you find vulnerabilities from Whitehat, push them directly into your Jira or ServiceNow platform for fast and measurable remediation. Track your progress; see how your team is doing at fixing vulns and reducing risk.

Easy to Use

Just like with any other Kenna connector, Whitehat integration is extremely easy to set up and use. Be up and running in a matter of minutes, and start gaining insight immediately.

Whether you want to see source code issues, dynamic web application issues, or infrastructure issues—or everything at once—the Kenna/Whitehat integration makes it easy. Your network and application vulnerabilities can be seen side-by-side, and you can see unified reporting on each.
